

Arachnoiditis Bulletin 4 Revised March-2018

NEUROINFLAMMATION

TREAT IT OR SUFFER

NEUROINFLAMMATION IS THE ROOT CAUSE OF ARC:

A cell known as “microglial” is in the nerve roots, and it causes neuroinflammation. There are also inflammatory cells in the arachnoid layer of the spine canal cover. Neuroinflammatory treatment is essential and the first step in treating ARC and AA.

WHY YOU NEED IT?

Pain relief medications such as opioids and nerve blockers are simply SYMPTOMATIC measures. SYMPTOMATIC DRUGS AND ELECTRICAL STIMULATORS DO NOT TREAT THE UNDERLYING CAUSE OF ARACHNOIDITIS WHICH IS NEUROINFLAMMATION.

In fact, pain treatment drugs may even provide comfort while neuroinflammation is silently progressing and waiting to later neutralize your symptomatic drugs and further debilitate you.

WHY CONTROL NEUROINFLAMMATION?

1. Long-term comfort;
2. Stop progression of AA;
3. Keep symptomatic drugs working;
4. Reverse and heal AA.

HOW TO START A NEUROINFLAMMATORY TREATMENT

You must experiment with several medicinal agents: drugs, hormones, herbs, and botanicals. No one size fits all.

- ✓ The most consistent prescription drugs in our experience that control neuroinflammation are ketorolac, methylprednisolone, and human chorionic gonadotropin (HCG).
- ✓ The most consistent, non-prescription agent in our experience that will control neuroinflammation is the hormone, pregnenolone, 100 to 300 mg a day.
