

ADHESIVE ARACHNOIDITIS (AA)

Bulletin 16

June 2020

THE INTRACTABLE PAIN SYNDROME

Our studies indicate that about 80% of persons with AA report “constant” pain which is the cardinal symptom of the Intractable Pain Syndrome (IPS). Once a person develops this syndrome, pain control requires specific therapy. To assist, the Tennant Foundation has initiated a 2nd “Research and Education” project dedicated solely to the recognition, prevention, and treatment of this condition. The website and email for the project are listed below. A detailed report on the syndrome is available. Every person, in our opinion, who has constant pain, for whatever reason, should read this report.

Official Definition of IPS

IPS is a complication of an underlying painful injury or disease that causes inflammation and tissue destruction inside the central nervous system which results in constant pain and physiologic and pathologic dysfunction of the neurologic, cardiovascular, endocrine, and immunologic systems.

FACT: The understanding, recognition, and new treatments for IPS are due to recent research with brain scans and laboratory testing.

Treatment of AA is: (1) suppress inflammation; (2) rebuild damaged tissue; and (3) reduce pain.

We have some new ideas for IPS. Read the new report.
